SERVICE PROCEDURES

1. Replacing the fuses

For continued protection against fire hazard, replace only with same type and same rating fuse.

D (120V) model

Circuit no.	Part no.	Description
F901	252052	7 A (ST-6), Primary

W (Worldwide) model

Circuit no.	Part no.	Description
F901	252052	7 A (ST-6), Primary
F902	252077	4 A-SE-EAK, Primary

2. Change of AM band step.

With the exception of the models below, a BAND STEP selector switch is not provided.

BAND STEP	D763, JL009
10kHz→ 9kHz	Additional
9kHz→10kHz	Eliminated

In D763 ISS133 (Part No. 223163) is used. Between #1 and #2 of JL009 a jumper lead must be inserted.

(Refer to page 23)

— Worldwide model —

Worldwide models are equipped with a step band selector switch. This switch is located on the back panel. This switch is set to 10kHz and 9kHz at the factory, but may have to be reset to 9kHz or 10kHz depending on the area where the unit is used.

	De-emphasis	AM step
Europe:	50 μ sec	9kHz
U.S.A.:	75 μ sec	10kHz

Change of voltage

Worldwide models are equipped with a voltage selector to conform with local power supplies. This switch is located on the back panel. Be sure to set this switch to match the voltage of the power supply in your area before turning the power switch on.

This switch is set to 220V at the factory. Voltage is changed by sliding the groove in the switch with the screw-driver to the right or left. Confirm that the switch has been moved all the way to the right or left before turning the power switch on.

POWER SUPPLY CIRCUIT PC BOARD

4. Safety-check out

(Only U.S.A. model)

After correcting the original service problem perform the following safety check before releasing the set to the customer.

Connect the insulating-resistance tester between the plug of power supply cord and terminal GND on the back panel. Specifications: 3.3 Mohm \pm 10% at 500V.

5. Memory preservation

This unit does not require memory preservation batteries. A built-in memory power back-up system preserves contents of the memory during power failures and even when the unit is unplugged. The unit must be plugged in and the power switch turned on and off once in order to charge the back-up system. Note that since this is not a permanent memory the power switch must be turned on and off a few times each month to keep the back-up system operative. The period of time during which memory contents are preserved after power has last been turned off varies depending on climate and placement of the unit. On the average, memory contents are protected over a period of 3 to 4 weeks (a minimum of 2 weeks) after the last time power has been turned off. This period is shorter when the unit is exposed to very high humidity or used in an area with an extremely humid climate.

Amplifier section

1. Idling current adjustment

Connect the DC voltmeter to the terminals IID and VCT on the power amplifier pc board.

Adjust the semi-fixed resistors R531 and R532 so that the indication of voltmeter is 15 ± 2 mV.

Notes: VOLUME Maximum, Open load,
Adjust after switching on for 15 minutes.

.21 MAX.

2. Check of operation of protection circuit.

1) Check of operation of protection relay.

- (1) Confirm that the relay turns ON approximately 5 seconds after the power switch is turned ON.
- (2) The relay should turn OFF approximately 0.5 seconds after the power switch is turned OFF.

2) Check of DC detection

- (1) Turn the power on with no load.
- (2) After the speaker relay turns ON, apply DC1~1.5V to the CD input terminals. Confirm that the relay turns OFF.
- (3) Confirm that operation is the same as (2) above when an input of DC-1~-1.5V is applied.

Note) Under no circumstances connect a load or short the speaker terminals when performing the above test.
